

# Lecture 5: Sequences & Series I

September 10, 2019

# What is a Sequence?

A sequence is a set of numbers written in some order

$$a_1, a_2, a_3, \dots, a_{n-1}, a_n$$

An infinite sequence can be thought of as a function whose domain is the set of positive integers  $i \in \mathbb{I}$  such that

$$a_i = f(i)$$

## Examples:

Give the first four terms of the following sequences

(a)  $a_n = \frac{n}{n+1}$

(b)  $a_n = 2 + (.1)^n$

(c)  $a_n = (-1)^{n+1} \frac{n^2}{3n-1}$

(d)  $a_n = 4$

# Limits of Sequences

A sequence  $\{a_n\}$  has the limit

$$\lim_{n \rightarrow \infty} \{a_n\} = L$$

if for all  $\epsilon > 0$  there exists a positive  $N$  such that  $|a_n - L| < \epsilon$  whenever  $n > N$ . If the limit exists then the sequence converges, otherwise the sequence diverges.

## Examples:

If possible, find the limit of the following sequences:

(a)  $\left\{ \frac{n}{2n+1} \right\}$

(b)  $\left\{ \frac{(-1)^n n^2}{1+n^3} \right\}$

(c)  $\left\{ \left(1 + \frac{c}{n}\right)^n \right\}$

# What is a Series?

If we add the terms of a sequence  $\{a_n\}$  then we get an infinite series.

$$a_1 + a_2 + \dots + a_n + \dots = \sum_{i=1}^{\infty} a_i$$

If we add the first  $n$  terms of a sequence, we get the  $n^{\text{th}}$  partial sum.

$$S_1 = a_1$$

$$S_2 = a_1 + a_2$$

$$\vdots = \vdots$$

$$S_n = a_1 + \dots + a_n$$

If the sequence of partial sums  $\{S_n\}$  converges and  $\lim_{n \rightarrow \infty} S_n = S$  then the series  $\sum_{i=1}^{\infty} a_i$  is convergent. Otherwise  $\sum_{i=1}^{\infty} a_i$  is divergent.

# Geometric Series

The geometric series has the form

$$a + ar + ar^2 + ar^3 + \dots = \sum_{n=1}^{\infty} ar^{n-1} \text{ for } a \neq 0$$

For  $|r| < 1$  the geometric series  $\sum_{n=1}^{\infty} ar^{n-1}$  converges and its sum is

$$\sum_{n=1}^{\infty} ar^{n-1} = \frac{a}{1-r}$$

## Examples:

- (a) Find the sum of  $\sum_{n=1}^{\infty} 2\left(\frac{3}{4}\right)^{n-1}$
- (b) Is this convergent and find its sum:  $4 + \frac{8}{5} + \frac{16}{25} + \frac{32}{125} + \dots$
- (c) Find the sum of  $\sum_{x=0}^{\infty} p(1-p)^x$
- (d) Does  $\sum_{n=1}^{\infty} 2^{2n}3^{1-n}$  converge?

# Limits and Convergence

## Theorem

*If the series  $\sum_{n=1}^{\infty} a_n$  is convergent, then*

$$\lim_{n \rightarrow \infty} a_n = 0$$

*If the  $\lim_{n \rightarrow \infty} a_n$  does not exist or if  $\lim_{n \rightarrow \infty} a_n \neq 0$ , then the series  $\sum_{n=1}^{\infty} a_n$  is divergent.*

Note: If  $\lim_{n \rightarrow \infty} a_n = 0$ , this does not mean that  $\sum_{n=1}^{\infty} a_n$  is convergent.

## Example:

(a) Does  $\sum_{n=1}^{\infty} \frac{1}{n}$  converge?

# Convergence Rules

Let  $\{a_n\}$  and  $\{b_n\}$  be two sequences such that  $\sum_{n=1}^{\infty} a_n$  converges to  $A$  and  $\sum_{n=1}^{\infty} b_n$  converges to  $B$  and let  $c$  be a constant. Then

- (i)  $\sum_{n=1}^{\infty} a_n \pm \sum_{n=1}^{\infty} b_n = A \pm B$
- (ii)  $\sum_{n=1}^{\infty} ca_n = cA$
- (iii)  $(\sum_{n=1}^{\infty} a_n)(\sum_{n=1}^{\infty} b_n) = AB$

## Examples:

- (a) Does  $\sum_{n=1}^{\infty} (\frac{3}{n(n+1)} + \frac{1}{2^n})$  converge?
- (b) Coin flipping.
