# Series With Positive Terms

- (i) If  $a_i \geq 0$  for all  $i$ , then the partial sums  $S_n$  must be non-decreasing
- (ii) If the  $S_n$ 's are to approach a limit they cannot become arbitrarily large.

Suppose there exists some  $B \geq S_n$  for all  $n$ , then  $B$  is called an upper bound of the sequence  $\{S_n\}$ . The sequence is bounded. If  $B' < B$  such that  $S_n > B'$ .  $B$  is then called the least upper bound and

$$\sum_{n=1}^{\infty} a_n = B$$

Can characterize the sum of a infinite series as

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n a_i \text{ or } \sup_{n=1}^{\infty} \{S_n\}$$

# Tests of Convergence: Integral Test

If  $f$  is a continuous, positive, decreasing function on  $[k, \infty]$  and  $a_n = f(n)$ , then the series  $\sum_{n=k}^{\infty} a_n$  is convergent if and only if the improper integral  $\int_k^{\infty} f(x) dx$  is convergent.

## Examples:

(a)  $\sum_{n=1}^{\infty} ne^{-n^2}$

(b)  $\sum_{n=0}^{\infty} \frac{n^2}{n^3+1}$

(c) For what values of  $p$  does the series  $\sum_{n=1}^{\infty} \frac{1}{x^p}$  converge?

# Tests of Convergence: Limit Comparison Test

Suppose  $\sum a_n$  and  $\sum b_n$  are series with positive terms. Then

- (i) If  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = c > 0$ , then either both series converge or diverge.
- (ii) If  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$  and  $\sum b_n$  converges, then  $\sum a_n$  converges.
- (iii) If  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty$  and  $\sum b_n$  diverges then  $\sum a_n$  diverges.

## Examples:

- (a) Test  $\sum_{n=1}^{\infty} \frac{1}{2^n - 1}$  for convergence.
- (b) Test  $\sum_{n=1}^{\infty} \frac{\ln n}{n}$  for convergence.
- (c) Test  $\sum_{n=3}^{\infty} \frac{e^{-n}}{n^2 + 2n}$  for convergence.

# Tests of Convergence: Ratio Test

Let  $a_n$  be any sequence

- (i) If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L < 1$  then the series  $\sum a_n$  is convergent.
- (ii) If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L > 1$  then the series  $\sum a_n$  is divergent.
- (iii) If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$  then the test fails.

## Examples:

- (a) Test  $\sum_{n=1}^{\infty} \frac{n^n}{n!}$  for convergence
- (b) Test  $\sum_{n=3}^{\infty} \frac{e^{4n}}{(n-2)!}$  for convergence
- (c) Test  $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{6n+7}$  for convergence

# Absolute Convergence

Consider any sequence  $a_1, a_2, \dots$ . A series  $\sum_{n=1}^{\infty} a_n$  converges absolutely if the series  $\sum_{n=1}^{\infty} |a_n|$  converges.

## Examples:

- (a) Test  $\sum_{n=1}^{\infty} \frac{(-1)^{n+2}}{n^2}$  for absolute convergence
- (b) Test  $\sum_{n=1}^{\infty} \frac{(-1)^n}{n}$  for absolute convergence

# Strategies for Testing Series

Classify according to the form of the series

- (1) P-series  $\sum \frac{1}{n^p}$  is convergent if  $p > 1$  and divergent if  $p \leq 1$
- (2) Geometric series  $\sum ar^{n-1}$  or  $\sum ar^n$  is convergent if  $|r| < 1$  and divergent if  $|r| \geq 1$
- (3) If the series has the form that is similar to (1) or (2), then use the limit comparison test
- (4) If you can notice that  $\lim_{n \rightarrow \infty} a_n \neq 0$  then use the test for divergence theorem
- (5) For series involving factorials or other products, use the ratio test
- (6) If  $a_n = f(n)$  and  $\int_k^\infty f(x) dx$  is easy to evaluate, use the integral test

# Power Series

Let  $x$  be any number and  $\{a_n\}$  by a sequence of numbers. A power series is any series of the form

$$\sum_{n=1}^{\infty} a_n x^n$$

with partial sums  $S_n = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$

## Examples:

- (a) For what values of  $x$  does the series  $\sum_{n=0}^{\infty} rx^n$  converge?
- (b) For what values of  $x$  does the series  $\sum_{n=0}^{\infty} \frac{x^n}{n!}$  converge?

# Taylor Series

Most common use is to approximate the value of functions at particular points.

## Theorem (Taylor Series)

*Let  $f$  be a function defined on a neighborhood of  $c \in \mathbb{R}$  with  $n$  continuous derivatives. Then*

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(c)}{n!} (x - c)^n$$

*is called the Taylor series of  $f$  around  $c$ .*

## Examples:

- (a) Find the Taylor Series expansion of  $f(x) = e^{-x}$  about  $x = 0$
- (b) Find the Taylor Series expansion of  $f(x) = \ln x$  about  $x = 2$
- (c) Find the Taylor Series expansion of  $f(x) = (1 + x)^n$  about  $x = 0$
