## **Lecture 1: Limits and Continuity**

August 27, 2019

### What is a Limit?

We are often interested in values of f(x) of a function f when x is very close to a number a, but not necessarily equal to a. In many cases f(a) is not defined.

$$\lim_{x \to a} f(x) = L$$

In words: The limit of f(x) as x approaches a is equal to L.

#### **Example:**

- (a)  $\lim_{x\to 4} \frac{1}{2}(3x-1)$
- (b)  $\lim_{x \to 9} \frac{x-9}{\sqrt{x}-3}$
- (c)  $\lim_{x\to 2} x^2 x + 2$

### **Formal Definition of Limit**

Let f(x) be a function of x defined on some open interval  $\mathbb{R}$  that contains a point a except possibly a itself. Then

$$\lim_{x \to a} f(x) = L$$

if and only if for every  $\epsilon > 0$  there is  $\delta > 0$  such that  $|f(x) - L| < \epsilon$  whenever  $0 < |x - a| < \delta$ .

#### Some notes:

- 1. f(x) does not have to equal L for the limit to exist.
- 2. Examine the behavior of f(x) as  $x \to \infty$ .
- 3. The limit does not have to exist.

#### **Example:**

(a) Show  $\lim_{x\to 0} x^2 = 0$ 

### **One-sided Limits**

We can examine the limit as x approaches from the left or right. This is called a one-sided limit.

Left-handed limit : 
$$\lim_{x \to a^{-}} f(x) = L^{-}$$

Left-handed limit : 
$$\lim_{x \to a^-} f(x) = L^-$$
  
Right-handed limit :  $\lim_{x \to a^+} f(x) = L^+$ 

For the limit to exist  $L^- = L^+ = L$ 

#### **Example:**

(a) 
$$f(x) = \begin{cases} 0 & \text{for } x < 0 \\ 1 & \text{for } x \ge 0 \end{cases}$$

### **Limit Laws**

Suppose *c* is a constant, *n* is a positive integer, and  $\lim_{x \to a} f(x)$  and  $\lim_{x \to a} g(x)$  exist.

1. 
$$\lim_{x \to a} [f(x) + g(x)] = \lim_{x \to a} f(x) + \lim_{x \to a} g(x)$$

2. 
$$\lim_{x \to a} [f(x) - g(x)] = \lim_{x \to a} f(x) - \lim_{x \to a} g(x)$$

3. 
$$\lim_{x \to a} [cf(x)] = c \lim_{x \to a} f(x)$$

4. 
$$\lim_{x \to a} [f(x)g(x)] = \lim_{x \to a} f(x) \lim_{x \to a} g(x)$$

5. 
$$\lim_{x \to a} \frac{f(x)}{G(X)} = \frac{\lim_{x \to a} f(x)}{\lim_{x \to a} g(x)}$$
 if  $\lim_{x \to a} g(x) \neq 0$ 

6. 
$$\lim_{x \to a} [f(x)]^n = [\lim_{x \to a} f(x)]^n$$

## **Limit Laws**

7. 
$$\lim_{x\to a} c = c$$

8. 
$$\lim_{x \to a} x = a$$

9. 
$$\lim_{r \to a} x^n = a^n$$

$$10. \lim_{x \to a} \sqrt[n]{x} = \sqrt[n]{a}$$

11. 
$$\lim_{x \to a} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x \to a} f(x)}$$

### **Examples:**

- (a) Find  $\lim_{x \to 2} \frac{3x+4}{5x+7}$
- (b) Show that for every real number a,  $\lim_{x\to a} x^3 = a^3$
- (c) Find  $\lim_{x\to 2} (3x + 4)^5$

# **Continuity**

A function is continuous at a number a if  $\lim_{x\to a} f(x) = f(a)$ . This definition requires that:

- 1. f(a) is defined
- 2.  $\lim_{x \to a} f(x)$  exists.
- 3.  $\lim_{x \to a} f(x) = f(a)$

A continuous function has the property that a small change in x produces only a small change in f(x).

#### **Example:**

(a) Is  $f(x) = \frac{x^2 - x + 2}{x - 2}$  continuous at 8 and 4?

## **Types of Continuity**

### **Left & Right Continuity**

We can examine the continuity of a function from either the left or the right.

Left continuous : 
$$\lim_{x \to a^{-}} f(x) = f(a)$$

Right continuous : 
$$\lim_{x \to a^+} f(x) = f(a)$$

f is continuous if and only if f is continuous from the left and right at every point in its domain.

### **Interval Continuity**

f is continuous on [a,b] if it is continuous on every point on the interval

### **Example:**

(a) Show that  $f(x) = 1 - \sqrt{1 - x^2}$  is continuous on [-1, 1]
